

ESG IT Sustainability

ESG IT Sustainability is a key focus for retail companies. It involves reducing the carbon footprint of IT operations, improving energy efficiency, and ensuring data security. Retailers are increasingly adopting AI and cloud services, which can significantly impact their ESG performance.

Retailers are also focusing on sustainable IT practices. For example, many companies are using green data centers and renewable energy sources. This helps reduce their overall carbon footprint and improves their ESG ratings.

McKinsey's research shows that companies with strong ESG performance are more likely to attract investors and customers. In 2016, 65% of retail companies reported that they had implemented sustainable IT practices. This is up from 5% in 2010.

Scope 2 emissions are a major concern for retail companies. These are the emissions from the electricity used to power IT operations. Retailers are working to reduce their Scope 2 emissions by using renewable energy and improving energy efficiency.
